Organize skills, knowledge and asks across your organization

Juggr

Skills across functions, shared knowledge your brain can tap into, asks streamlined org-wide.

Juggr · AgenticHQ LLC · juggr.io

Each person's AI works in a silo

```
$ across the organization
skills      per person
knowledge   in heads
asks        chat + email
```

Skills, knowledge and requests stay with individuals and their own agents. Nothing is organized across functions.

01

Skills stay siloed

Each person and function builds its own skills; others can't find or reuse them.

02

Knowledge stays stuck

What people and their agents learn stays in one head or one chat history.

03

Asks get lost

Requests scatter across chat and email, with no routing, owner or follow-through.

A shared brain for the organization

Juggr is software that connects each person's AI to the organization's skills, knowledge and asks.

Each person's brain
Their own knowledge and memory, on the AI they use (Claude today)

Juggr
Function packs and skills · shared knowledge spaces · one list of asks (org-wide routing planned)

Trust layer
Approval cards, guard checks, Ask first or Auto, runs locally

JuggrOS: one app for skills, knowledge and asks

Each person keeps their own brain; JuggrOS connects it to the team's skills, shared knowledge and asks.

Atlas, Juggr's assistant

Reads your project folders read only. Asks before high-impact actions; unanswered requests are denied.

Shared knowledge

Your knowledge and per-client memory, built. Sharing with colleagues through a lead's review: in progress.

01

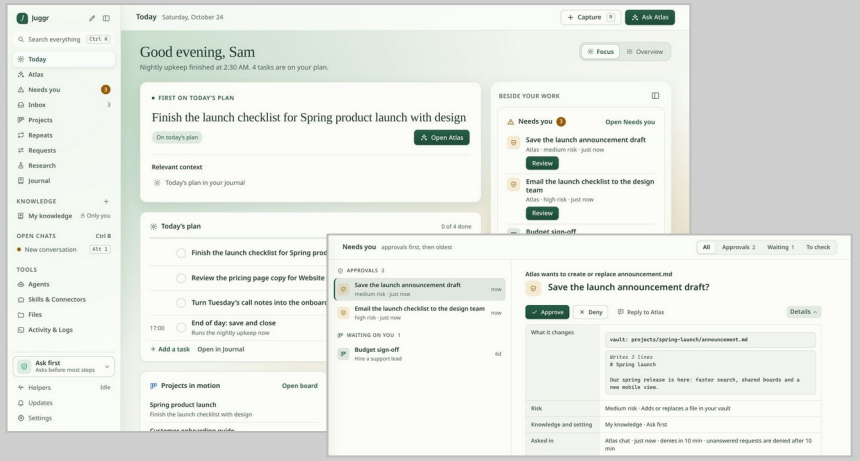

Skills

Four function packs (Marketing, Finance & Ops, Product & Projects, Client Work) and built-in skills. Lead-approved team skills: built, off in the trial.

02

Asks

My tasks: steps, asks and requests in one list. Org-wide routing and roll-up: planned.

Today and Needs you, demo data

Every agent write passes guard checks

Writes stay in bounds

Vault lock: one agent at a time, so nobody collides.

Guard hooks block writes to protected paths.

Risk stays contained

Secret scan on each commit. AI work merges only via gated branches.

Financial actions stay suggest-only.

Two modes, one switch per chat: Ask first (default) and Auto. Every write still passes guard checks.

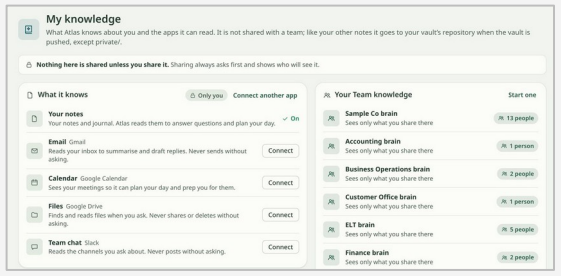

Ask first (default)

Auto

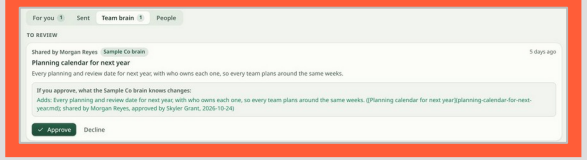

Knowledge moves up only with approval

A Brain is a knowledge base for a person, a team or a company.

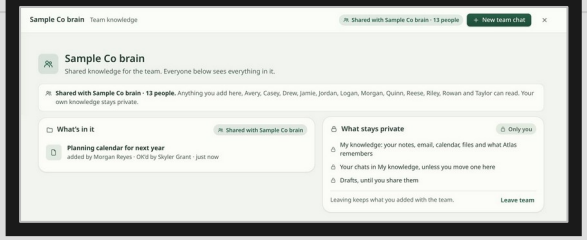

private
brain-you/

share-up
needs approval

shared
brain-team/

Draft

Your knowledge stays private until you share it.

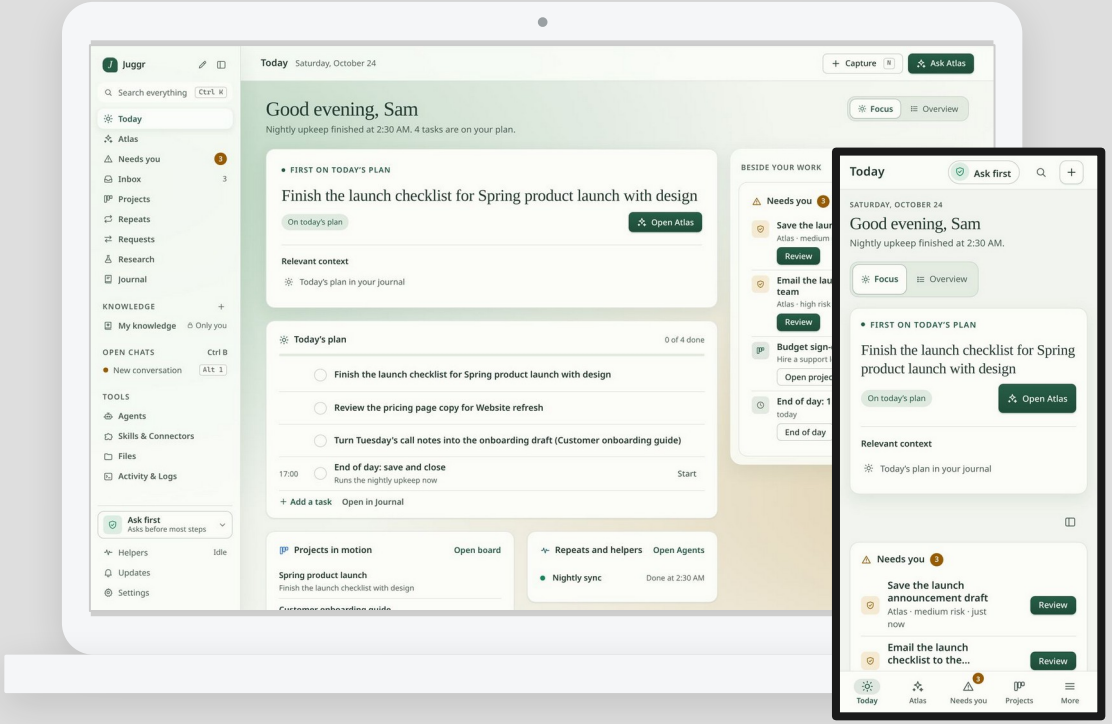

Review

A reviewer sees exactly what changes, then approves or declines.

Publish

Approved notes reach the company, with who OK'd them.

Colleague sharing through a lead's review: in progress, being hardened before any teammate joins.

JuggrOS on desktop and phone

Four places: Today, Work, Knowledge and Team. Today shows your plan, what needs you and your projects. Screens show demo data.

Who it’s for, and why now

```
$ a 10-200 person org, today
AI use      per person
skills      per function
asks        chat + email
```

Cross-functional organizations of 10–200 people, where each person already uses AI on their own.

01

Who

Organizations of 10–200 people across several functions, many non-technical.

02

Why now

People now bring their own AI to work; organizations need that work to add up.

03

What’s missing

No shared skills, no shared knowledge spaces, no way to route asks across functions.

STACK

whisper.cpp

large-v3-turbo, local

~0.4 s

per voice clip, local GPU

Planned

Open models on rented NVIDIA GPUs

Fast on NVIDIA right now

Uses a local NVIDIA GPU when the machine has one

Today: voice input via whisper.cpp large-v3-turbo on a local NVIDIA GPU, about 0.4 s per clip (4 GB+ VRAM).

Planned: open models on rented NVIDIA GPUs; evaluating NVIDIA NIM and Riva.

v0.8.1
starter kit, current version on juggr.io

3,373
commits on main, Oct 11–Nov 10, 2026 (approx.)

#251
latest merged pull request (Nov 10, 2026)

~90
roadmap items, each with a tracked status (Nov 9)

Early: founder-built, founder-used

Pre-revenue. Only the founder uses JuggrOS so far; no outside users.

Next proof

Founder's own-work trial, then a design-partner pilot

Two camps, one gap

01

Personal agents

OpenClaw: a personal agent in chat apps; no team review.

Strawberry Browser: AI browser companions; work stays in its app.

02

Agent platforms and suites

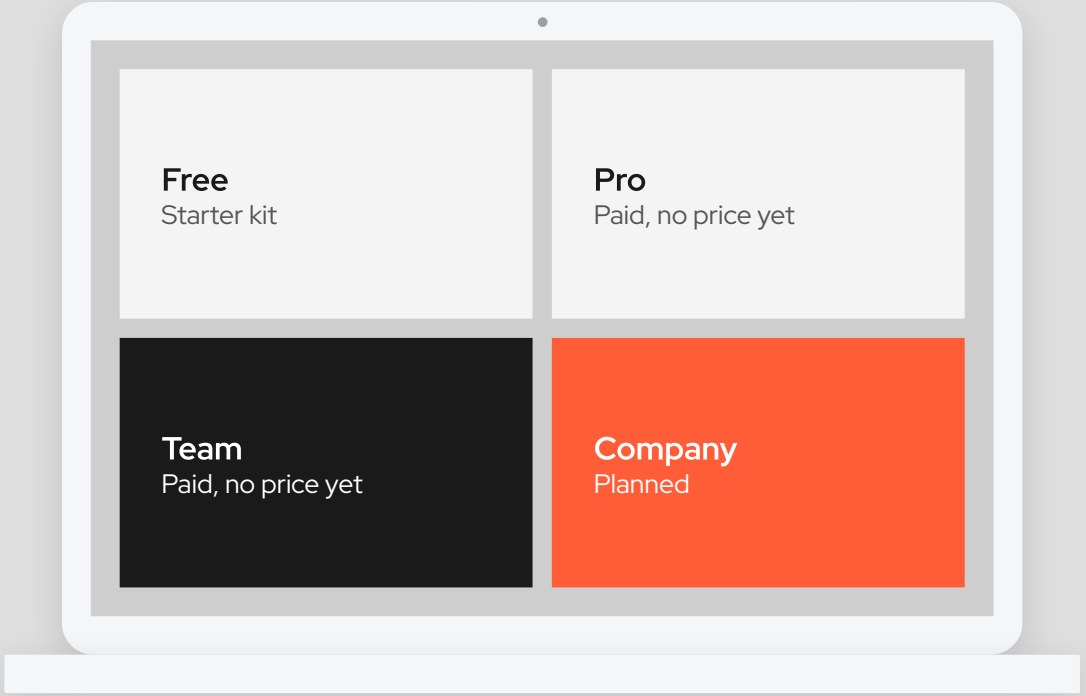

Agno: a developer toolkit; not a ready team workspace.

Microsoft Copilot (Memory): view, delete or turn off; no team review described.

One camp remembers for one person; the other builds or bundles agents. Neither organizes skills, knowledge and asks across an organization.

Juggr: function packs and skills, shared knowledge spaces and one list of asks (org-wide routing planned), with approvals on risky steps.

Skills + knowledge + asks = Juggr

Free to start, paid to scale

Free to start with the starter kit; Pro and Team plans are paid, and a Company plan is planned. No prices set yet.

4 plans

Prices to be set with design partners.

software only

Roadmap

Plan as of November 2026: the founder's own-work trial first, then widening to teams. Coral text marks pass tests and decisions from the current roadmap.

Now

Own-work trial

The founder's own work on one exact build: bring it in, correct a fact, bring it back, undo

Undo under 2 s · Bring over under 4 s

Next

Design-partner pilot

Projects that learn from every session; an always-on team agent

"What's stuck?" answered in 45 s or less

Then

Team depth

Colleague sharing, handover, and team skills a lead approves

Successor scores a handover 4+ of 5 · 80%+ of open asks carry over

Later

Second AI, org-wide asks

A second AI provider; asks that split to owners and roll up

Paid-terms decision with the first partner

RAISING

$250K

Pre-seed, for 12–18 months.

Use of funds: the roadmap's next 16 weeks, plus paid design partners.

THE ASK

Become a design partner: partners@juggr.io

Also applying: NVIDIA Inception

Team & ask

Sylvain Nehme, solo founder (part-time)

9 years in SaaS finance/BizOps, AI Champion.
